

04

Decision makers hear the community's voice

The permanent display of the community's desire to clean the Veringkanal manifested in the "mark the stone" installation has finally reached decision makers who can finance and guide the project.

05

The institution(s) organize the cleaning of the Veringkanal

Ideally the institution(s) will convene the community and together cleanse the Veringkanal.

06

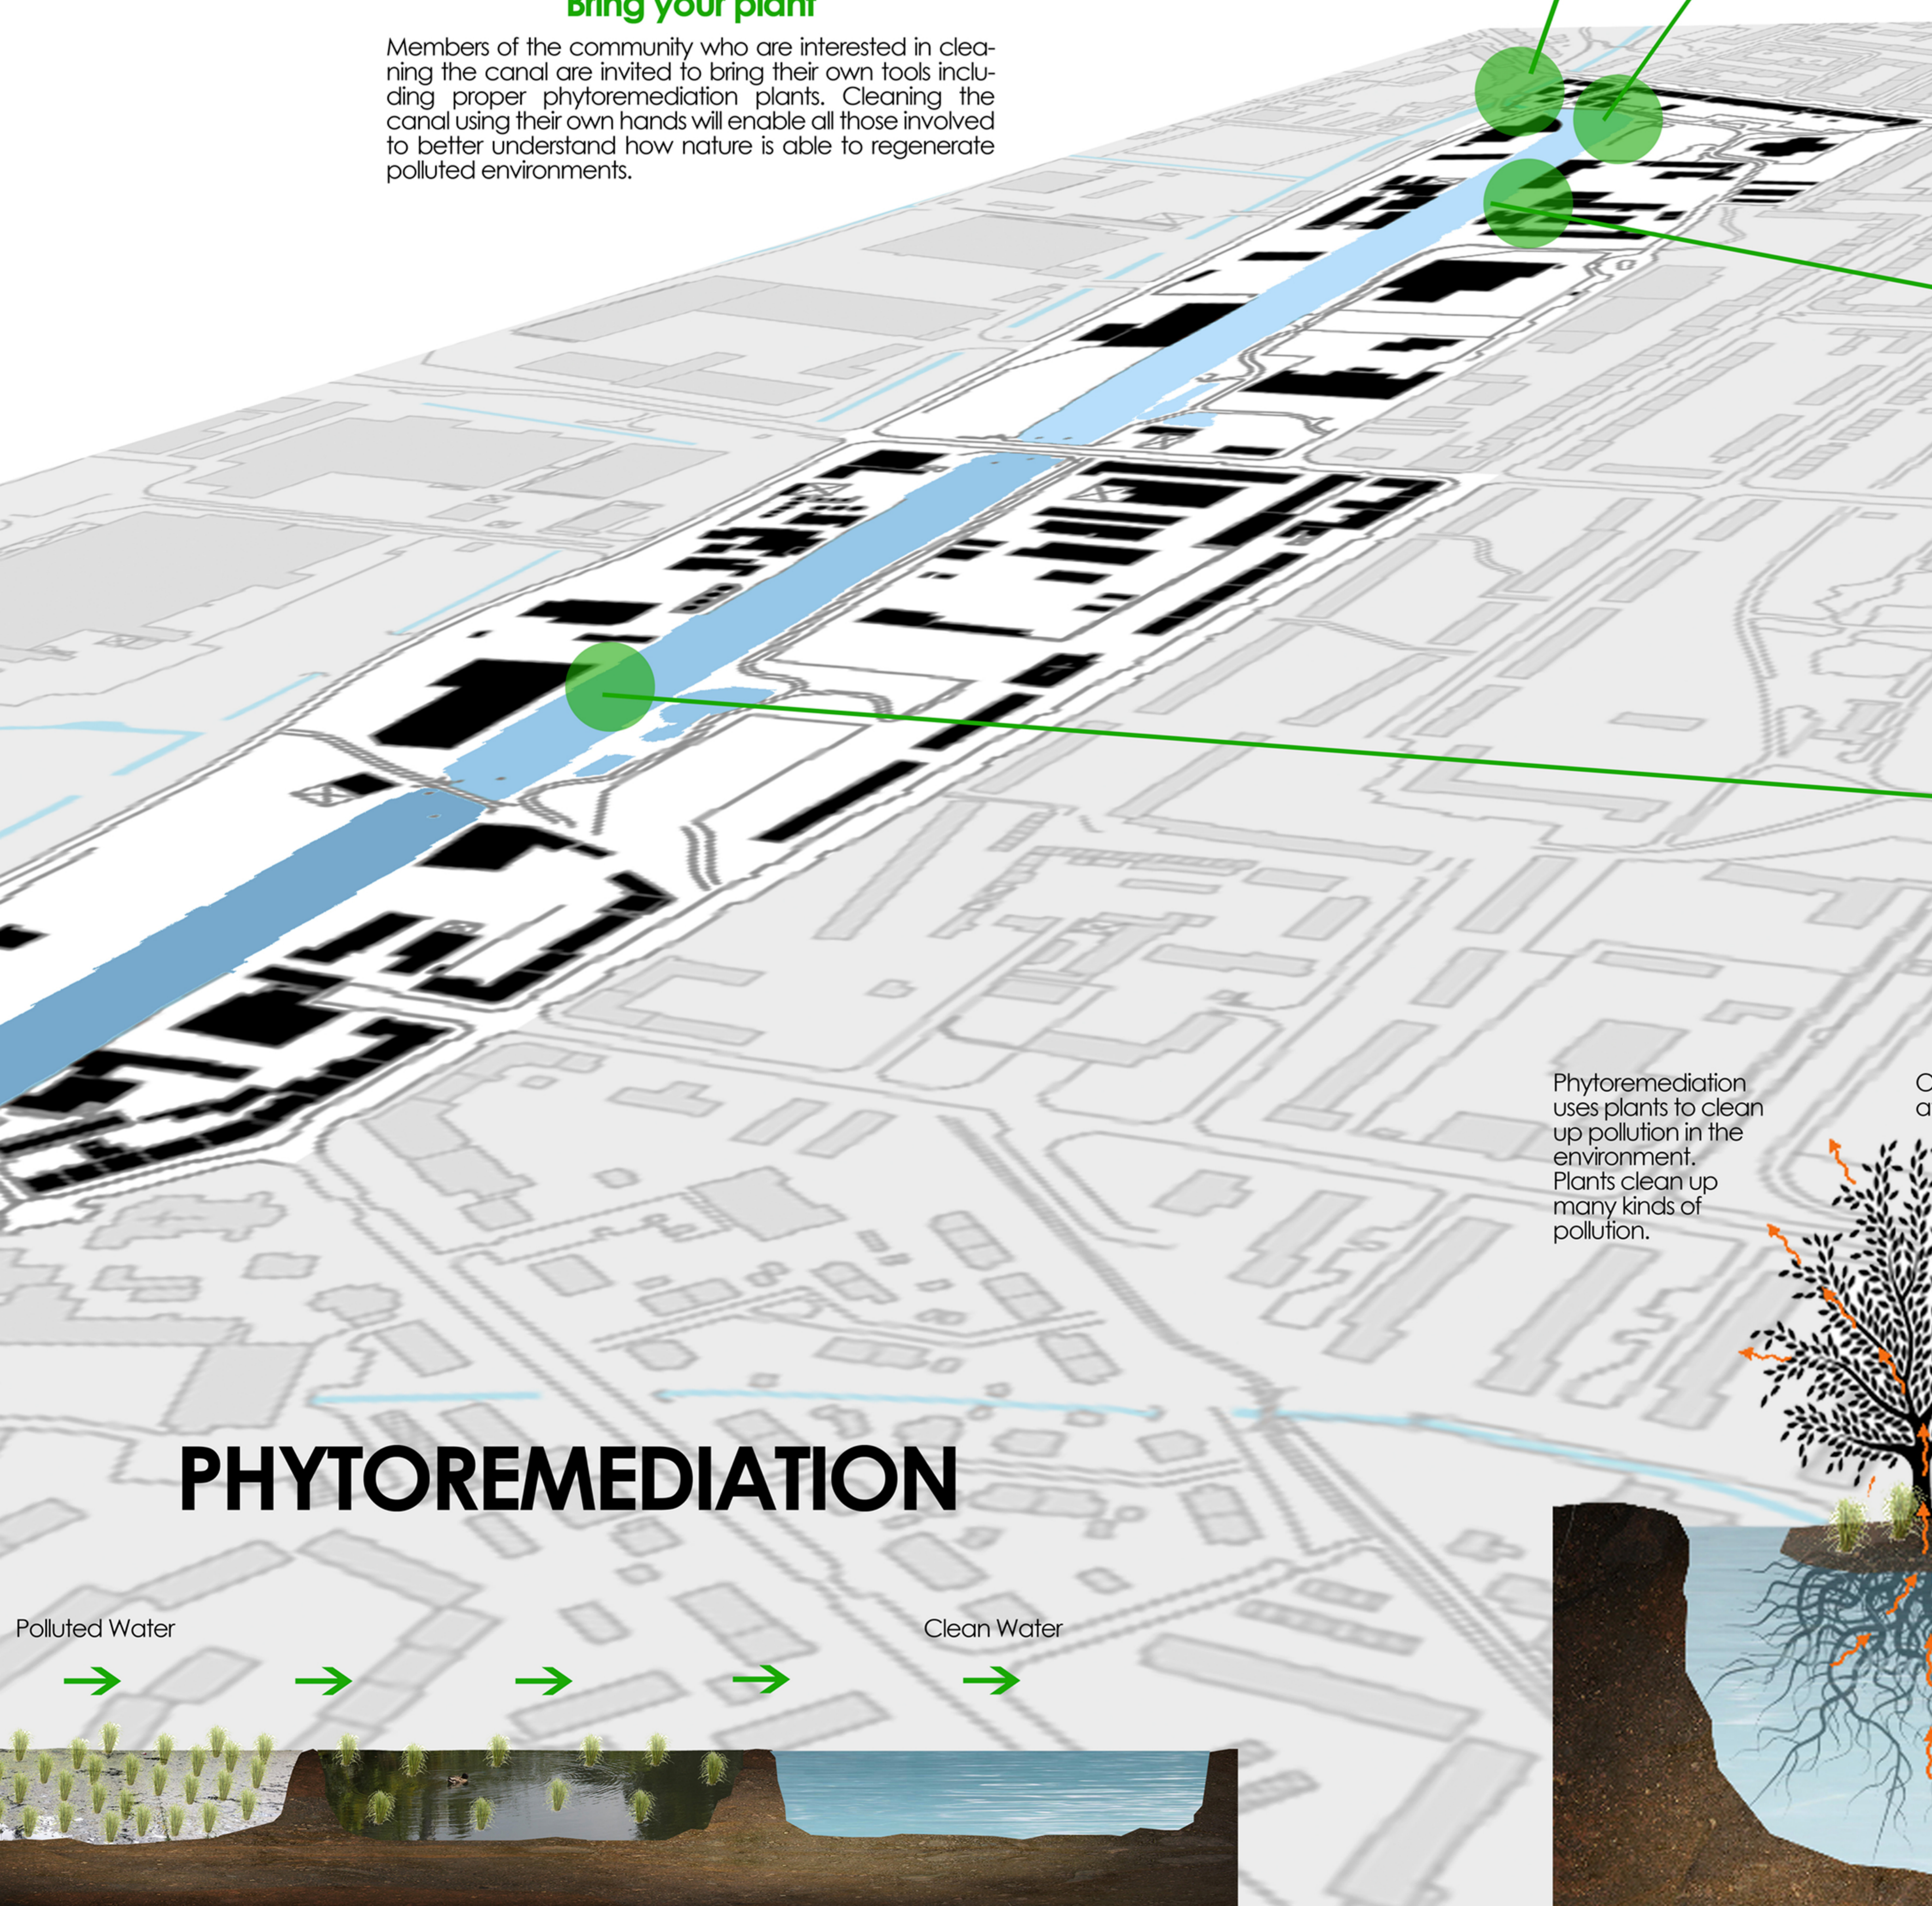

Bring your plant

Members of the community who are interested in cleaning the canal are invited to bring their own tools including proper phytoremediation plants. Cleaning the canal using their own hands will enable all those involved to better understand how nature is able to regenerate polluted environments.

Phytoremediation uses plants to clean up pollution in the environment. Plants clean up many kinds of pollution.

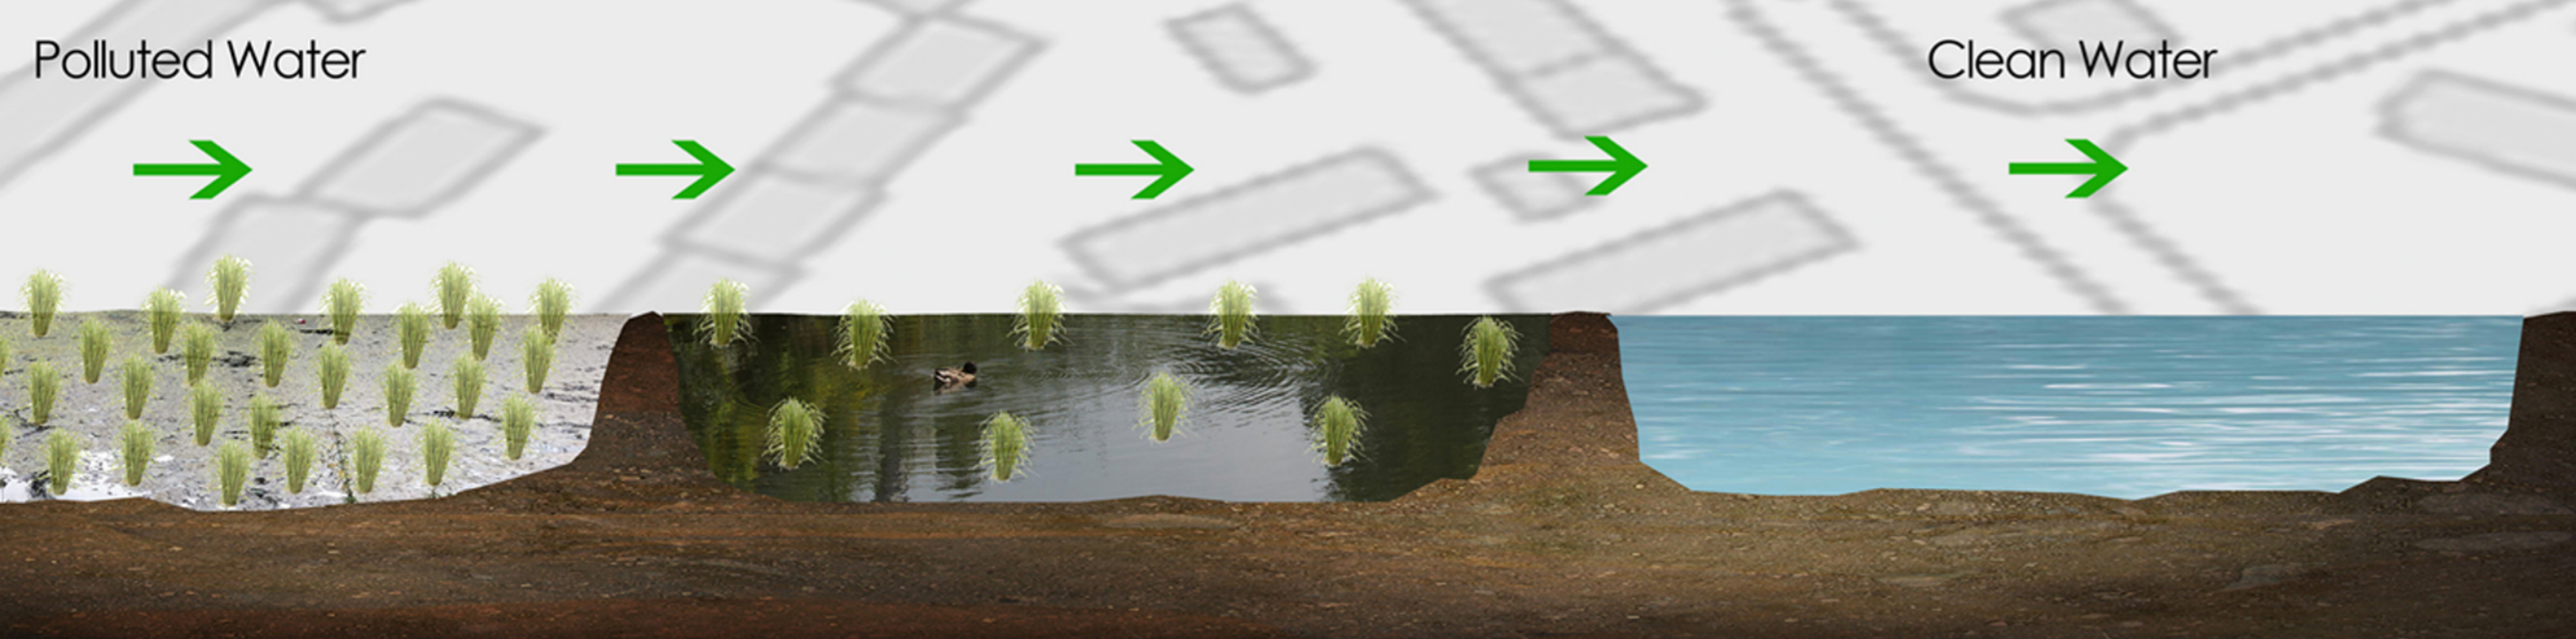

Other pollutants are released to the atmosphere as harmless gases into the air

Some pollutants are stored in the roots, leaves and stems/trunks.

Plants remove pollutants from water and soil with their roots.

PHYTOREMEDIATION
